Functioning of a pool heater

The pool water is pumped directly through the collectors spreading the flow evenly across the entire collector surface.

The existing pool pump can be used in most cases for operating the system.

Additional benefits:

- modular design
- any collector field size is possible (parallel configuration)
- simple expansion
- easy installation
- high efficiency
- robust, step-on design
- freeze resistant – even when filled with water
- TÜV certified
- heat resistant from -50°C to $+115^{\circ}\text{C}$
